

Fugro Data Solutions provides a complete range of data enhancement services to the E&P industry...

Well Data Conditioning

Oil companies increasingly require rapid access to high quality digital well log data. Fugro Data Solutions (FDS) has been supplying the industry since the early 1990s on a non-exclusive basis over all regions of the globe.

Any data enhancement project is reliant on an accurate and consistent set of wireline data; a continuous recording of a geophysical data along a borehole. FDS performs various aspects of wireline data processing, including data loading, verification, digitisation, curve editing, depth matching, splicing and if required, formation evaluation. FDS can provide the client with a comprehensive, digital log dataset.

Well Processing

- Creation of schematic/well diagrams
- Tapes and prints matched
- Loading of data
- Data verified
- Composite data sets created

Digitising

- Enhancement of poor quality corrupt or missing data.
- High quality and quick turnaround make FDS a market leader for licence rounds.
- Capacity of one million curve feet per week.

Interpretation

- Environmental corrections to improve data quality
- Analysis giving lithology and fluids
- Detailed formation models with modern data sets
- Cased hole analysis
- Formation Description Logs

Scanning

- High performance A4/A3 scanners (85 pages per min)
- Colour to B&W on the fly
- OCR files created
- High quality wide format scanning (up to 55 inches wide)
